

## Assessment Schedule – 2007

## Chemistry: Describe properties and reactions of carbon and its compounds (90648)

## Evidence Statement

Question	Evidence	Achievement	Achievement with Merit	Achievement with Excellence
ONE (a)	<p>1 Butane</p> <p>2</p> <pre>       H   H             H — C — C — H           //       H   C — H                       H           </pre> <p>3 methanol</p> <p>4</p> <pre>       H   O              H — C — C — O — H               H           </pre>	THREE names or structures correct. Must have all hydrogens.		
(b)	methanol and ethanoic acid or 3 and 4	Both correct.		
(c)	$C_4H_{10}(g) + 6.5O_2(g) \rightarrow 4CO_2(g) + 5H_2O(g)$ or $2C_4H_{10}(g) + 13O_2(g) \rightarrow 8CO_2(g) + 10H_2O(g)$	<p>Correct formulae of reactants or products.</p> <p>States not required.</p>	<p>Correct formula of reactants and products</p> <p>States not required.</p>	<p>Correctly balanced equation.</p> <p>States not required.</p>
(d)	$\left[ \begin{array}{cccccc} CH_3 & H & CH_3 & H & CH_3 & H \\   &   &   &   &   &   \\ -C & -C & -C & -C & -C & -C- \\   &   &   &   &   &   \\ H & H & H & H & H & H \end{array} \right]_n$	All single bonds, only carbons and hydrogens, with at least 6 carbons shown, and without a hydrogen at one end OR puts in methyl groups correctly but misses some H's.	Main chain has methyl side groups. Has drawn 3 repeating units.	

(e)	<p><b>Chemical properties:</b></p> <ul style="list-style-type: none"> <li>Both liquids will undergo combustion reactions.</li> <li>Ethanol can be oxidized to ethanoic acid.</li> </ul> <p><b>Physical properties:</b></p> <ul style="list-style-type: none"> <li>Hexane is immiscible in water, forming 2 layers, whereas ethanol is miscible in water forming a solution.</li> <li>Hexane is a bigger molecule than ethanol (diagram acceptable), but both have similar boiling points.</li> <li>Hexane is less dense than ethanol.</li> </ul> <p>Distinguish by solubility in water, or by burning droplets on a spatula, or by finding the mass of the same volume of liquid, or by distilling under carefully controlled conditions (hexane bp 68.7 °C ethanol bp 78.3 °C).</p>	<p>Compares TWO aspects of the two liquids appropriately (can include smell).</p> <p>OR</p> <p>Distinguishes between the liquids, but method is not completely clear/safe.</p>	<p>Describes a clear method for distinguishing between the liquids safely, using a chemical or a physical property.</p> <p>OR</p> <p>Compares both a chemical and a physical property, with some method of distinguishing them.</p>	<p>Compares a chemical property AND A physical property of both compounds AND Distinguishes between liquids clearly and safely.</p>
TWO (a)(i)	Graphite burns brightly/sparks/smoke formed/soot formed/graphite disappears/heat generated.	ONE correct observation.		
(a)(ii)	As graphite burns, the amount of oxygen decreases as it is a closed system until graphite is burning in a limited supply – incomplete combustion.	Identifies incomplete combustion. OR Limited oxygen	Explains that incomplete combustion is due to limited oxygen.	
(b)(i)	$\text{CO}_2(g) + \text{H}_2\text{O}(\ell) \rightarrow \text{H}_2\text{CO}_3(aq)$ <p>or</p> $\text{CO}_2(g) + 2\text{H}_2\text{O}(\ell) \rightarrow \text{HCO}_3^-(aq) + \text{H}_3\text{O}^+(aq)$	<p>Correctly balanced equation.</p> <p>States not required.</p>		
(b)(ii)	Solution would turn red because CO <sub>2</sub> in water forms an acidic solution. Acidic solution due to carbonic acid/ H <sup>+</sup> ions/low pH	States colour change of litmus AND acknowledges formation of acid.	Links colour change of litmus to the formation of acid solution AND states carbonic acid/hydrogen carbonate/hydrogen ions/low pH.	
(c)	Oxygen is used to burn sugars for energy and CO <sub>2</sub> is a byproduct of the reaction.	<p>Food/sugars/glucose/carbon compounds “burn” to produce carbon dioxide</p> <p>OR oxygen (aerobic) is taken in and carbon dioxide released</p> <p>OR CO<sub>2</sub> is a waste product of respiration.</p>	Oxygen is required to react with sugar/glucose and produces CO <sub>2</sub> .	

(d)	<ul style="list-style-type: none"> <li>Combustion of fuels leads to higher levels of CO<sub>2</sub> in the atmosphere and CO, C, SO<sub>2</sub>, NO<sub>x</sub>.</li> </ul> <p>Further discussion on:</p> <ul style="list-style-type: none"> <li>"greenhouse effect". (CO<sub>2</sub> is transparent to light but rather opaque to heat rays.) Therefore, CO<sub>2</sub> in the atmosphere slows down the radiation of heat from the earth back into space — This leads to global warming which is seen in:               <ul style="list-style-type: none"> <li>increased ocean/land temps</li> <li>retreat of glaciers</li> <li>change in migration and breeding of species</li> <li>new growth and flowering patterns of plants</li> <li>extreme weather events</li> <li>decreased agricultural yields</li> <li>spread of disease via warmer conditions for carriers.</li> </ul> </li> <li>Acid rain</li> <li>Photochemical smog</li> <li>Health effects on humans               <ul style="list-style-type: none"> <li>respiratory problems from C, SO<sub>2</sub>, NO<sub>x</sub></li> <li>CO binding to haemoglobin.</li> </ul> </li> </ul>	<p>Identifies CO<sub>2</sub> as a combustion product AND states CO<sub>2</sub> is a cause of global warming.</p> <p>OR</p> <p>Identifies a non-metal oxide produced as a result of fuel combustion and an appropriate effect on the global environment.</p>	<p>Explains role of ONE non-metal oxide in affecting the atmosphere.</p> <p>AND</p> <p>Describes TWO valid implications for the global environment.</p>	<p>Explains role of TWO non-metal oxides which produce different effects on the atmosphere AND Describes ONE valid implication for each non-metal oxide on the global environment.</p> <p>OR</p> <p>An in-depth analysis of ONE combustion product and its effects.</p>
THREE (a)	(i) acid (ii) carbonate	Both answers correct.		
(b)(i)	Limewater goes milky.	Correct.		
(b)(ii)	$\text{Ca(OH)}_2(aq) + \text{CO}_2(g) \rightarrow \text{CaCO}_3(s) + \text{H}_2\text{O}(\ell)$ OR $\text{Ca(OH)}_2 + 2\text{CO}_2 \rightarrow \text{Ca(HCO}_3)_2$	<p>Correct formulae of reactants OR products.</p> <p>States not required.</p>	<p>Correct formulae of reactants AND products.</p> <p>States not required.</p>	
(c)	<p>CO<sub>2</sub> doesn't support combustion so cannot be used by the fire as a fuel/cannot be further oxidised.</p> <p>CO<sub>2</sub> is denser than air so it 'suffocates' the fire by falling on it and displacing air (oxygen), which is then not available for the combustion reaction.</p> <p>CO<sub>2</sub> is easily compressed and a lot of CO<sub>2</sub> can be stored in a small container (fire extinguisher).</p> <p>CO<sub>2</sub> sublimates when pressure is released, so it quickly becomes a gas again.</p> <p>CO<sub>2</sub> is non-toxic so can be used without making fire fighting more hazardous</p> <p>CO<sub>2</sub> is a non-conductor so can be used on electrical fires</p> <p>CO<sub>2</sub> is generally chemically inert so can be used on a wide variety of substances</p>	<p>States TWO relevant properties.</p> <p>OR</p> <p>Links one property to use in a fire extinguisher.</p>	<p>States TWO relevant properties.</p> <p>AND</p> <p>Links one property to use in a fire extinguisher.</p>	<p>Discusses at least THREE relevant properties in relation to the use of CO<sub>2</sub> in a fire extinguisher.</p> <p>Must include a physical AND a chemical property.</p>

**Judgement Statement — 2007**

<b>Achievement</b>	<b>Achievement with Merit</b>	<b>Achievement with Excellence</b>
<p>EIGHT opportunities answered at Achievement level (or higher).</p> <p>Minimum of <math>8 \times A</math></p>	<p>NINE opportunities answered including at least FOUR at Merit level (or higher) and FIVE at Achievement level (or higher).</p> <p>Minimum <math>4 \times M + 5 \times A</math></p>	<p>ELEVEN opportunities answered including at least TWO at Excellence level plus FOUR at Merit level (or higher) and FIVE at Achievement level (or higher).</p> <p>Minimum <math>2 \times E + 4 \times M + 5 \times A</math></p>
