Level 3 Physics, 2006

90522 Demonstrate understanding of atoms, photons and nuclei

Credits: Three 9.30 am Monday 20 November 2006

Check that the National Student Number (NSN) on your admission slip is the same as the number at the top of this page.

You should answer ALL the questions in this booklet.

For all numerical answers, full working must be shown, and the answer must be rounded to the correct number of significant figures and given with an SI unit.

For all 'describe' or 'explain' questions, the answers should be written or drawn clearly with all logic fully explained.

Formulae you may find useful are given on page 2.

If you need more space for any answer, use the page(s) provided at the back of this booklet and clearly number the question.

Check that this booklet has pages 2–8 in the correct order and that none of these pages is blank.

YOU MUST HAND THIS BOOKLET TO THE SUPERVISOR AT THE END OF THE EXAMINATION.

For Assessor's use only	Achievement Criteria		
Achievement	Achievement with Merit	Achievement with Excellence	
Identify or describe aspects of phenomena, concepts or principles.	Give explanations in terms of phenomena, concepts, principles and/or relationships.	Give explanations that show clear understanding in terms of phenomena, concepts, principles and/or relationships.	
Solve straightforward problems.	Solve problems.	Solve complex problems.	
Overall Level of Performance (all criteria within a column are met)			

You are advised to spend 35 minutes answering the questions in this booklet.

Assessor's use only

You may find the following formulae useful.

$$E = hf$$

$$hf = \phi + E_K$$

$$E = \Delta mc^2$$

$$E_n = -\frac{\text{hcR}}{n^2}$$

$$\frac{1}{\lambda} = R(\frac{1}{S^2} - \frac{1}{L^2})$$

$$E_P = qV$$

$$v = f \lambda$$

QUESTION ONE: NUCLEAR REACTIONS

Mass of nuclei:

neutron: $1.67492 \times 10^{-27} \text{ kg}$ proton: $1.67353 \times 10^{-27} \text{ kg}$ deuterium: $3.34449 \times 10^{-27} \text{ kg}$ tritium: $5.00827 \times 10^{-27} \text{ kg}$ helium-4: $6.64648 \times 10^{-27} \text{ kg}$ lithium-6: $9.98835 \times 10^{-27} \text{ kg}$

Speed of light = $3.00 \times 10^8 \text{ m s}^{-1}$

Three bottles of water and some rocks can provide, in theory, enough energy for a family for one year. The water and rocks can be used to obtain the raw materials for a thermonuclear reaction that can take place between deuterium and tritium.

Tritium can be made from lithium ⁶₃Li, which can be extracted from the rocks.

(a) Show that the mass deficit of a lithium nucleus is 5.700×10^{-29} kg.

(b) Calculate the binding energy per nucleon for the lithium nucleus.

binding energy per nucleon =

Assessor's use only

(c)	State how the binding energy per nucleo	on can indicate the stability of a nucleus.
Deut deut	terium (hydrogen–2) can be extracted fro erium and tritium to 100 million degrees	m the water. Thermonuclear reactors heat a mixture of Celsius to produce the reaction illustrated below.
	Deuterium	Helium-4
	Tritium	Energy
The :	nuclear equation for this reaction is: ² ₁ H - Calculate the amount of energy produce	
(e)	Explain why it is necessary for the temp	energy = perature to be so high for this reaction to occur.

QUESTION TWO: SOLAR POWER

Assessor's use only

Rydberg's constant = $1.097 \times 10^7 \text{ m}^{-1}$ Planck's constant = $6.63 \times 10^{-34} \text{ J s}$ Speed of light = $3.00 \times 10^8 \text{ m s}^{-1}$

Nuclear reactions in the Sun produce light. The main element in the Sun is hydrogen. The spectrum of hydrogen can be observed in the laboratory with a hydrogen discharge tube.

The visible lines in the hydrogen spectrum are called the Balmer series and are described by the formula:

 $\frac{1}{\lambda} = R\left(\frac{1}{S^2} - \frac{1}{L^2}\right)$

where S = 2.

(a)	Calculate the wavelength of the lowest frequency line in the Balmer series ($L = 3$). Give the answer to the correct number of significant figures.	
	wavelength =	
(b)	Explain how light of this particular frequency is produced in the hydrogen atom.	

What is the wayslandth of the second photon?	
What is the wavelength of the second photon?	
	wavelength =

QUESTION THREE: NIGHT VISION CAMERA

Assessor's	
use only	

Planck's constant = $6.63 \times 10^{-34} \text{ J s}$

	ght vision camera, like the one shown below, detects low levels of light on the photo-cathode,		
	th releases a few electrons. A photomultiplier increases the number of electrons, which then hit creen to produce an image.		
	Source http://www.lancs.ac.uk/ug/jacksom2/		
(a)	Name the effect that causes electrons to be released by the photo-cathode.		
(b)	The photo-cathode material of this night vision camera prevents it detecting infrared radiation. State why this is so.		
	photo-cathode is made of a material that has a work function of 2.58×10^{-19} J. Calculate the lowest frequency of light that could release a photoelectron.		
(c)	Calculate the lowest frequency of fight that could release a photoelectron.		
	frequency =		

Assessor's use only

e p	hoto-cathode is replaced with a different material. When it is illuminated with light of length 2.80×10^{-7} m, electrons with a maximum kinetic energy of 3.04×10^{-19} J are produced.
e p	hoto-cathode is replaced with a different material. When it is illuminated with light of length 2.80×10^{-7} m, electrons with a maximum kinetic energy of 3.04×10^{-19} J are produced. Calculate the threshold frequency for the material.
ve	length 2.80×10^{-7} m, electrons with a maximum kinetic energy of 3.04×10^{-19} J are produced.
ve	length 2.80×10^{-7} m, electrons with a maximum kinetic energy of 3.04×10^{-19} J are produced.
ve	length 2.80×10^{-7} m, electrons with a maximum kinetic energy of 3.04×10^{-19} J are produced.
